SUMMARY OF THE RISK MANAGEMENT PLAN

FOR

QINLOCK (RIPRETINIB)

Deciphera Pharmaceuticals (Schweiz) AG

Document version: 2.0

Date of this document: 02 Feb 2023

Based on Part VI of EU RMP version 2.1 (data lock point: 14 May 2022)

The Risk Management Plan (RMP) is a comprehensive document submitted as part of the application dossier for market approval of a medicine. The RMP summary contains information on the medicine's safety profile and explains the measures that are taken in order to further investigate and follow the risks as well as to prevent or minimise them.

The RMP summary of QINLOCK is a concise document and does not claim to be exhaustive.

As the RMP is an international document, the summary might differ from the "Arzneimittelinformation / Information sur le médicament" approved and published in Switzerland, e.g., by mentioning risks occurring in populations or indications not included in the Swiss authorization.

Please note that the reference document which is valid and relevant for the effective and safe use of QINLOCK in Switzerland is the "Arzneimittelinformation/Information sur le médicament" (see www.swissmedic.ch) approved and authorized by Swissmedic. Deciphera Pharmaceuticals AG is fully responsible for the accuracy and correctness of the content of the published summary RMP of QINLOCK.

Summary of risk management plan for QINLOCK

This is a summary of the risk management plan (RMP) for QINLOCK. The RMP details important risks of QINLOCK, how these risks can be minimised, and how more information will be obtained about QINLOCK's risks and uncertainties (missing information).

QINLOCK's summary of product characteristics (SmPC) and its package leaflet give essential information to healthcare professionals and patients on how QINLOCK should be used.

This summary of the RMP for QINLOCK should be read in the context of all this information including the assessment report of the evaluation and its plain-language summary, all which is part of the European Public Assessment Report (EPAR).

Important new concerns or changes to the current ones will be included in updates of QINLOCK's RMP.

I. The medicine and what it is used for

QINLOCK is authorised for the treatment of adult patients with advanced gastrointestinal stromal tumours (GIST) who have received at least 3 or more kinase inhibitors including imatinib (see Product Information for the full indication). It contains ripretinib as the active substance and it is given orally.

Further information about the evaluation of QINLOCK's benefits can be found in QINLOCK's EPAR, including in its plain-language summary, available on the EMA website, under the medicine's webpage https://www.ema.europa.eu/en/medicines/human/EPAR/qinlock.

II. Risks associated with the medicine and activities to minimize or further characterize the risks

Important risks of QINLOCK, together with measures to minimize such risks and the proposed studies for learning more about QINLOCK's risks, are outlined below.

Measures to minimize the risks identified for medicinal products can be:

- Specific information, such as warnings, precautions, and advice on correct use, in the package leaflet and SmPC addressed to patients and healthcare professionals;
- Important advice on the medicine's packaging;
- The authorized pack size the amount of medicine in a pack is chosen so to ensure that the medicine is used correctly;
- The medicine's legal status the way a medicine is supplied to the patient (e.g. with or without prescription) can help to minimize its risks.

Together, these measures constitute routine risk minimisation measures.

In addition to these measures, information about adverse reactions is collected continuously and regularly analysed, including periodic safety updated report (PSUR) assessment - so that immediate action can be taken, as necessary. These measures constitute *routine pharmacovigilance activities*.

If important information that may affect the safe use of QINLOCK is not yet available, it is listed under 'missing information' below.

Page 2 of 9

II.A List of important risks and missing information

Important risks of QINLOCK are risks that need special risk management activities to further investigate or minimize the risk, so that the medicinal product can be safely taken. Important risks can be regarded as identified or potential. Identified risks are concerns for which there is sufficient proof of a link with the use of QINLOCK. Potential risks are concerns for which an association with the use of this medicine is possible based on available data, but this association has not been established yet and needs further evaluation. Missing information refers to information on the safety of the medicinal product that is currently missing and needs to be collected (e.g. on the long-term use of the medicine);

List of important risks and missing information	
Important identified risks	Palmar-plantar erythrodysaesthesia syndrome Hypertension Cardiac failure Squamous cell carcinoma of skin Malignant melanoma
Important potential risks	Embryo-foetal toxicity Phototoxicity
Missing information	Use in patients with moderate or severe hepatic impairment Use in patients with severe renal impairment

II.B Summary of important risks

Important identified risk: Palmar-plantar erythrodysaesthesia		
Evidence for linking the risk	Palmar-plantar erythrodysaesthesia syndrome (PPES) also known as hand-foot skin reaction (HFSR) is a common adverse reaction of TKIs.	
	In Study DCC-2618-03-001, PPES occurred in 22.4% (19 of 85) of patients treated with ripretinib 150 mg daily. All events were mild or moderate in severity. PPES was not seen in patients treated with placebo in the study.	
to the medicine	Non-clinical studies also showed signs of potential adverse effects on skin (300 mg/kg/day in rats and 10 mg/kg/day in dogs).	
	Clinical trials can provide an estimation of the frequency and nature of an adverse reaction that is expected to occur in clinical practice. Nonclinical findings may be relevant for humans and in the absence of clinical data suggest a potential safety concern that awaits clinical confirmation.	
Risk factors and risk groups	Some cancer therapies, including tyrosine kinase inhibitors, are recognized to cause PPES and therefore patients treated with these therapies are at increased risk.	
	Patients whose jobs require a significant amount of walking or hand friction are at greater risk of developing these skin toxicities and use of caustic cleaning solutions and hot water are also contributors (Smith and Abou-Alfa, 2010). The severity of PPES is related to pressure, friction and heat, and tends to be more severe in younger, 'more-active' patients (Edmonds et al., 2012).	
	Routine risk minimisation measures:	
	• Dose modifications for Grade 2 and Grade 3 PPES in SmPC Section 4.2	
Risk minimisation measures	• Treatment guidance in SmPC Section 4.4 and in package leaflet section 4	
	• SmPC Section 4.8	
	Package leaflet section 4	
	Restricted medical prescription	

Additional risk minimisation measures:
• None

Important identified risk: Hypertension		
Evidence for linking the risk	Hypertension occurred in 15.3% (13 of 85) of patients treated with ripretinib 150 mg daily and 4.7% (2 of 43) of patients treated with placebo in Study DCC-2618-03-001. Hypertension was severe (Grade 3) in 6 (7.1%) patients treated with ripretinib.	
to the medicine	Nonclinical studies also suggested an effect on blood pressure.	
	Clinical trials can provide an estimation of the frequency and nature of an adverse reaction that is expected to occur in clinical practice. Nonclinical findings may be relevant for humans and in the absence of clinical data suggest a potential safety concern that awaits clinical confirmation.	
Risk factors and risk groups	The potential risk group for hypertension or its complications are patients with uncontrolled hypertension. Other risk factors for hypertension include increased age, a family history of hypertension, African heritage, increased weight or obesity, physical inactivity, tobacco use, high salt intake and low potassium dietary intake, increased alcohol consumption, stress, and certain chronic conditions including kidney disease, diabetes, and sleep apnoea (Mayo Clinic, 2019).	
	Routine risk minimisation measures:	
Risk minimisation measures	• Dose modifications and medical management of Grade 3 hypertension and to permanently discontinue ripretinib for Grade 4 hypertension in SmPC Section 4.2	
	Warning on the actions to take in SmPC Section 4.4	
	• SmPC Section 4.8	
	Package leaflet section 4	
	Restricted medical prescription	
	Additional risk minimisation measures:	
	• None	

Important identified risk: Cardiac Failure	
Evidence for linking the risk to the medicine	Tyrosine kinase inhibitors are recognised to cause cardiac dysfunction. Cardiac failure occurred in 1.2% (1 of 85) of patients treated with ripretinib 150 mg daily during the double-blind treatment period in Study DCC-2618-03-001 and none in placebo treated patients. The event was of Grade 3 severity. Clinical trials can provide an estimation of the frequency and nature of an adverse reaction that is expected to occur in clinical practice.

Risk factors and risk groups	Patients with a history of cardiac disease appear to be at increased risk, a population that should be under constant monitoring for their underlying condition. Risk factors for cardiac failure include hypertension, coronary artery disease, myocardial infarction, diabetes, sleep apnoea, congenital heart defects, valvular heart disease, viral infection, alcohol use, tobacco use, obesity, and irregular heartbeats (Mayo Clinic, 2020).
	Certain medications may lead to cardiac failure including diabetes medications rosiglitazone (Avandia) and pioglitazone (Actos), nonsteroidal anti-inflammatory drugs (NSAIDs); certain anaesthesia medications; some anti-arrhythmic medications; certain medications used to treat high blood pressure, cancer, blood conditions, neurological conditions, psychiatric conditions, lung conditions, urological conditions, inflammatory conditions and infections; and other prescription and over-the-counter medications (Mayo Clinic, 2020). Tyrosine kinase inhibitors are recognised to cause cardiac dysfunction and therefore patients treated with these therapies are at increased risk.
Risk minimisation measures	 Routine risk minimisation measures: Guidance to discontinue ripretinib in case of Grade 3 or 4 left ventricular systolic dysfunction in SmPC Sections 4.2 and 4.4 Warning to assess ejection fraction prior to initiating ripretinib and during treatment as clinically indicated in SmPC Section 4.4 SmPC Section 4.8 Package leaflet section 4 Restricted medical prescription Additional risk minimisation measures: None

Important identified risk: Squamous cell carcinoma of skin	
Evidence for linking the risk to the medicine	Squamous cell carcinoma of skin occurred in 5.9% (5 of 85) of patients treated with ripretinib 150 mg daily and in no patients treated with placebo in Study DCC-2618-03-001. Majority of these patients experienced Grade 2 severity squamous cell carcinoma of skin with only 1 patient experiencing Grade 3 severity squamous cell carcinoma of skin. Clinical trials can provide an estimation of the frequency and nature of an adverse reaction that is expected to occur in clinical practice.
Risk factors and risk groups	The most common risk factor for squamous cell carcinoma is ultraviolet radiation which frequently produces point mutations in double-stranded DNA, resulting in the formation of thymidine dimers in the p53 tumour-suppressor gene (Inayat and Saif, 2016). Failure of repair mechanisms may then lead to tumour formation. Squamous cell carcinoma has also been associated with immunosuppression, arsenic exposure, radiation, chronic ulcers, human papillomavirus (HPV) infection, and tyrosine kinase inhibitors such as imatinib mesylate (Inayat and Saif, 2016).
Risk minimisation measures	 Routine risk minimisation measures: Warning for patients to receive dermatological examinations when initiating ripretinib and routinely during treatment and on the actions to take in SmPC Section 4.4 and in package leaflet sections 2 and 4 Warning to manage suspicious skin lesions with excision and dermatopathological evaluation in SmPC Section 4.4 SmPC Section 4.8 Package leaflet section 4

Restricted medical prescription
Additional risk minimisation measures:
• None

Important identified risk: Malignant melanoma	
Evidence for linking the risk to the medicine	In Deciphera sponsored clinical trials, 9.2% of ripretinib treated patients experienced melanocytic nevi, 1.3% experienced melanoma, and 0.6% experienced both events. All events were mild or moderate in severity and the majority were non-serious. Two cases of malignant melanoma have also been reported during post-marketing. Clinical trials can provide an estimation of the frequency and nature of an adverse reaction that is expected to occur in clinical practice.
Risk factors and risk groups	Ultraviolet (UV) radiation is considered the principal risk factor for melanoma; indoor tanning is also associated with an increased risk (Matthews et al., 2017). Other risk factors of melanoma include moles (dysplastic nevi), fair skin, family history, genetic factors (CDKN2A mutation causes familial atypical multiple mole melanoma [FAMMM] syndrome), other inherited conditions (xeroderma pigmentosum, retinoblastoma, Li-Fraumeni syndrome, Werner syndrome, and certain hereditary breast and ovarian cancer syndromes), previous skin cancer, inflammatory bowel disease (Crohn's disease and ulcerative colitis), weakened or suppressed immune system, and obesity (Cancer Net 2022).
Risk minimisation measures	Routine risk minimisation measures: • Warning for patients to receive dermatological examinations when initiating ripretinib and routinely during treatment and on the actions to take in SmPC Section 4.4 and in package leaflet sections 2 and 4 • Warning to manage suspicious skin lesions with excision and dermatopathological evaluation in SmPC section 4.4 • SmPC Section 4.8 • Package leaflet section 4 • Restricted medical prescription Additional risk minimisation measures: • None

Important potential risk: Embryo-foetal toxicity	
Evidence for linking the risk to the medicine	There are no data available for ripretinib exposure in pregnant women. Use of ripretinib during pregnancy has not been evaluated in the clinical development programme.
	In animal embryo-foetal toxicity studies ripretinib was teratogenic in rats, with malformations observed in the cardiovascular and skeletal systems.
	Nonclinical findings may be relevant for humans and in the absence of clinical data suggest a potential safety concern that awaits clinical confirmation.
Risk factors and risk groups	Females of childbearing potential and males with partners of reproductive potential must be informed that QINLOCK may cause foetal harm, and must ensure effective contraception during treatment and at least 1 week after the final dose of QINLOCK.
Risk minimisation measures	Routine risk minimisation measures: • Recommendation to advise women to avoid pregnancy while taking ripretinib unless clearly necessary, to verify the pregnancy status prior to initiating ripretinib and during the treatment, and to use effective

contraception during treatment (with a barrier method of contraception if systemic contraceptive steroids are used) for at least 1 week after the final dose in SmPC Section 4.4 and Section 4.6 and in package leaflet section 2
• Information on non-clinical findings in SmPC Section 5.3
Restricted medical prescription
Additional risk minimisation measures:
• None

Important potential risk: Phototoxicity	
Evidence for linking the risk to the medicine	The nonclinical data suggested that ripretinib and metabolite DP-5439 exhibit the potential for ultraviolet (UV)-induced phototoxicity in an in vitro assay. In integrated analysis pool 3 data only 1% (4 of 392) of patients experienced adverse events related to photosensitivity. Majority (3 of 4) of these patients (0.8%, 3 of 392) experienced mild events; and only 1 patient (0.2%) experienced event of moderate intensity. None of the photosensitivity events were considered as serious or were reported with severe intensity.
	Clinical trials can provide an estimation of the frequency and nature of an adverse reaction that is expected to occur in clinical practice. Nonclinical findings may be relevant for humans and in the absence of significant clinical data suggest a potential safety concern that needs further clinical confirmation.
Risk factors and risk groups	No major risk factors were identified. However, patient's exposure to strong sunlight, sunlamps, and other sources of ultraviolets radiation and the absence of prophylactic skin care (e.g., $SPF \geq 30$, hypoallergenic moisturizing creams or ointments for dry skin, and gentle skincare with fragrance-free soaps and detergents) can increase the chances of occurrence of photosensitivity reactions.
	Routine risk minimisation measures:
Risk minimisation measures	 Recommendation to patients to avoid or minimise exposure to direct sunlight, sunlamps, and other sources of ultraviolet radiation due to the risk of phototoxicity associated with ripretinib; and advise patients to use measures such as protective clothing (long sleeves and hat) and sunscreen with high SPF in SmPC Section 4.4 and in package leaflet section 2
	Restricted medical prescription
	Additional risk minimisation measures:
	• None

Missing information: Use in patients with moderate or severe hepatic impairment	
Risk minimisation measures	Routine risk minimisation measures:
	• Information that pharmacokinetics and safety in patients with moderate or severe hepatic impairment have not been studied and that no dosing recommendation can be made in this subgroup in SmPC in Section 4.2 and 5.2 and in package leaflet section 3
	Guidance to closely monitor the overall safety in patients with moderate and severe hepatic impairment in SmPC Section 4.2
	Restricted medical prescription
	Additional risk minimisation measures:
	• None
Additional pharmacovigilance activities	Additional pharmacovigilance activities:
	• Study DCC-2618-01-004
	See section II.C of this summary for an overview of the post-authorisation development plan.

Missing information: Use in patients with severe renal impairment		
Risk minimisation measures	 Routine risk minimisation measures: Information that only limited clinical data are available in patients with severe renal impairment (CLcr <30 mL/min) and that a recommended dose of ripretinib has not been established in patients with severe renal impairment in SmPC Section 4.2 and 5.2 and in package leaflet section 3 Restricted medical prescription Additional risk minimisation measures: None 	

II.C Post-authorisation development plan

II.C.1 Studies which are conditions of the marketing authorisation

There are no studies which are conditions of the marketing authorisation or specific obligation of ripretinib.

II.C.2 Other studies in post-authorisation development plan

Study DCC-2618-01-004

Purpose of the study:

To investigate the impact of mild, moderate, and severe hepatic impairment on ripretinib PK.

To assess the PK, safety, and tolerability of a single 50 mg dose of ripretinib in subjects with hepatic impairment compared to matched healthy subjects with normal hepatic function.
