QPPV signature:

The Risk Management Plan (RMP) is a comprehensive document submitted as part of the application dossier for market approval of a medicine. The RMP summary contains information on the medicine's safety profile and explains the measures that are taken in order to further investigate and follow the risks as well as to prevent or minimise them.

The RMP summary of "Carbaglu" is a concise document and does not claim to be exhaustive. As the RMP is an international document, the summary might differ from the "Arzneimittelinformation / Information sur le médicament" approved and published in Switzerland, e.g. by mentioning risks occurring in populations or indications not included in the Swiss authorization.

Please note that the reference document which is valid and relevant for the effective and safe use of "Carbaglu" in Switzerland is the "Arzneimittelinformation / Information sur le médicament" (see [www.swissmedic.ch](http://www.swissmedic.ch)) approved and authorized by Swissmedic. "Recordati AG" is fully responsible for the accuracy and correctness of the content of the published summary RMP of "Carbaglu"

## VI.1 Elements for summary tables in the EPAR

### VI.1.1 Summary table of Safety concerns

| Summary of safety concerns |  |
|----------------------------|--|
| Important identified risks | None   |
| Important potential risks  | None   |
| Missing information        | Use in pregnant women<br>Patients with cardiac diseases/renal and hepatic impairment<br>Long term safety |

### VI.1.2 Table of on-going and planned studies in the Post-authorisation Pharmacovigilance Development Plan

| Study title<br>Status  | Summary of objectives  | Safety concerns addressed   | Milestones       | Due dates    |
|--|--|---|------------------|--------------|
| <b>Category 1</b> - Imposed mandatory additional pharmacovigilance activities which are conditions of the marketing authorisation  |  |   |                  |              |
| Not applicable   |  |   |                  |              |
| <b>Category 2</b> – Imposed mandatory additional pharmacovigilance activities which are Specific Obligations in the context of a conditional marketing authorisation or a marketing authorisation under exceptional circumstances. |  |   |                  |              |
| Not applicable   |  |   |                  |              |
| <b>Category 3</b> - Required additional pharmacovigilance activities ( <b>Food and Drug Administration requirement</b> )   |  |   |                  |              |
| <b>Study 1604-2:</b> A registry of patients, including infants with NAGS deficiency and treated with CGA to obtain long-term clinical safety information.<br><br>Ongoing   | To obtain long-term clinical safety information in patients with NAGS deficiency treated with CGA. | Assess treatment with CGA for:<br>- Use in pregnant women<br>- Patients with cardiac diseases/renal and hepatic impairment<br>-Long-term safety | Study start      | Apr 2012     |
|  |  |   | Study completion | January 2027 |
| <b>Study 1604-3:</b> A study of the effects of CGA on pregnancy and foetal outcomes.<br><br>Ongoing  | To study of the effects of CGA on pregnancy and foetal outcomes.                                   | Assess treatment with CGA for Use in pregnant women.  | Study start      | Apr 2012     |
|  |  |   | Study completion | January 2027 |

|  |   |   |                  |                |
|--|---|---|------------------|----------------|
| <b>RRDUS-PASS-0573:</b> Short and long-term effects of the Carbaglu® treatment of hyperammonaemia due to MMA and PA in the adult and paediatric patient population.<br><br>Ongoing | Obtain short- and long-term clinical safety data in pediatric and adult patients with PA and MMA treated with Carbaglu.   | Assess treatment with CGA for:<br>-Long term safety<br>-Use in pregnant women | Study start      | June 2022      |
|  |   |   | Study completion | December 2032  |
| <b>Category</b> Other studies in the pharmacovigilance plan  |   |   |                  |                |
| <b>PROTECT Study:</b> Understanding the long-term management of organic acidaemia patients with Carbaglu: A mixed methods approach.<br><br>Ongoing                                 | To describe the number and duration of decompensation events in patients with a diagnosis of MMA or PA who have been receiving Carbaglu for a minimum of 6 months compared to the number and duration of decompensation events that occurred prior to starting treatment with Carbaglu. | Assess treatment with CGA for long-term safety.                               | Study start      | January 2019   |
|  |   |   | Study completion | September 2026 |

CGA=carglumic acid; NAGS=N-acetylglutamate synthase.

### VI.1.3 Summary of Post authorisation efficacy development plan

No post-authorization efficacy studies are planned or ongoing for Carbaglu.

### VI.1.4 Summary table of Risk Minimisation Measures

| Safety concern                           | Risk minimisation measures  | Pharmacovigilance activities   |
|--|---|--|
| <b>Important identified risks - None</b> |   |  |
| <b>Important potential risks - None</b>  |   |  |
| <b>Missing information</b>               |   |  |
| Use in pregnant women                    | <u>Routine risk minimisation measures:</u><br>SmPC Section 4.6.<br>PL section 2.<br><br>Section 4.6 of the SmPC for CGA which notes that animal studies have revealed minimal developmental toxicity, and that caution should be exercised when prescribing to pregnant women.<br>Section 4.6 of the SmPC for CGA which notes that CGA has been | <u>Routine pharmacovigilance activities beyond adverse reactions reporting and signal detection:</u><br>None.<br><br><u>Additional pharmacovigilance activities:</u><br>Study 1604-2 and Study 1604-3<br>Study RRDUS-PASS-0573 |

## VI.2 Elements for a Public Summary

### VI.2.1 Overview of disease epidemiology

#### *Hyperammonaemia due to N-acetylglutamate synthase primary deficiency*

N-acetylglutamate synthase primary deficiency is the rarest congenital UCD, which results in a severe defect of ammonia detoxification, which is fatal if untreated. When ammonia levels reach above 350 µmol/L at the first hyperammonaemic attack, most patients die or have severe neurological damage. Therefore, treatment must be started within 24 hours of hyperammonaemia diagnosis (as presumptive diagnosis of NAGS primary deficiency) to avoid irreversible brain damage. The major cause of mortality and morbidity is hyperammonaemia. Most therapeutic interventions have focused on the prevention and treatment of hyperammonaemia. However, as a cohort of treated patients gets older, other complications have appeared even without significant history of recurrent hyperammonaemia. The incidence of urea cycle disorders (UCDs), although difficult to ascertain, is estimated to be 1 in 35 000 living births. N-acetylglutamate synthase primary deficiency is the rarest of these disorders, with an estimated incidence of 1:3 500 000 to 7 000 000.

#### **Hyperammonaemia due to organic acidaemia**

Metabolic decompensation in IVA is potentially life threatening and can cause neurological sequelae, resulting in significant morbidity and mortality. A total of 40% of patients with MMA die between 40 days and 3 years; survival from 2 to 8 years is 60%. The outcome for children with severe forms of MMA remains poor. Patients have recurrent episodes of metabolic decompensation; many have neurodevelopmental complications and mortality is high. Long-term survivors develop chronic renal failure. In young patients with early-onset disease, liver transplantation might prevent complications and, for those in end-stage renal failure, kidney transplantation could be combined with that of the liver. The incidence of IVA has a range from 1:62 500 live births in parts of Germany to 1:250 000 in the US. The incidence of MMA in Western populations have ranged from 1:48 000 to 1:61 000 births, and overall incidence is believed to be around 1:50 000. The incidence of PA in Western populations have ranged from 1:50 000 to 1:500 000 births, and overall incidence is believed to be approximately 1:100 000 to 150 000.

### VI.2.2 Summary of treatment benefits

Carbaglu has been shown in vitro to activate liver CPS. Despite a lower affinity of CPS for Carbaglu compared to that for NAG, Carbaglu has been shown in vivo to stimulate CPS and to be much more effective than NAG in protecting against ammonia intoxication in rats. This could be explained by the following observations:

- The mitochondrial membrane is more readily permeable for Carbaglu than for NAG.
- Carbaglu is more resistant than NAG to hydrolysis by aminoacylase present in the cytosol.

Other studies have been conducted in rats under different experimental conditions leading to increased ammonia availability (i.e. starvation, protein-free or high-protein diet) Carbaglu was shown to decrease blood ammonia levels and increase urea levels in blood and urine, whereas the liver content of CPS activators was significantly increased.

In patients with N-acetylglutamate synthase deficiency, carginic acid was shown to induce a rapid normalisation of plasma ammonia levels, usually within 24 hours. When the treatment was instituted before any permanent brain damage, patients exhibit normal growth and psychomotor development. In patients with organic acidaemia (neonates and non-neonates), the treatment with carginic acid induced a quick decrease of ammonia plasma levels, reducing the risk of neurological complications.

### VI.2.3 Unknowns relating to treatment benefits

There are limited or no information concerning Carbaglu in pregnant and breastfeeding women, and effects on ability to drive and use machines have been performed. Therefore, it is unknown whether use of carbaglu in these populations will be profitable and safe.

### VI.2.4 Summary of safety concerns

#### Important identified risks

None

#### Important potential risks

None

#### Missing information

| Risk | What is known |
|------|---------------|
|------|---------------|

|   |   |
|---|---|
| Limited information on the use of CGA during pregnancy.   | Section 4.6 (Fertility, pregnancy and lactation) of the SmPC for CGA states that ‘Animal studies have revealed minimal developmental toxicity. Caution should be exercised when prescribing to pregnant women.’ The anticipated risk of use during pregnancy is to be further investigated and is considered missing information.   |
| Limited information on the use of CGA in patients with cardiac diseases/renal and hepatic impairment. | Section 4.4 (Special warnings and precautions for use) of the SmPC for Carbaglu notes that the dose of Carbaglu must be reduced in patients with renal impairment. Section 4.2 of the the SmPC for Carbaglu contains guidance on dose adjustments for patients with renal impairment and reminds that caution is advised when administering Carbaglu to patients with impaired renal function. Section 4.4 (Special warnings and precautions for use) of the SmPC for CGA states that ‘As very few data on the safety of CGA are available, systematic surveillance of liver, renal, cardiac functions and haematological parameters is recommended.’ The anticipated risk of CGA use in this patient population is to be further investigated and is considered missing information. |
| Limited information on long term safety   | The anticipated risk on long term safety is investigated in 3 ongoing Non interventional studies.   |

CGA=carglumic acid; SmPC=Summary of Product Characteristics; CCDS=Company Core Data Sheet; MedDRA=Medical Dictionary for Regulatory Activities; PT=Preferred Term

#### VI.2.5 *Summary of risk minimisation measures by safety concern*

All medicines have a Summary of Product Characteristics (SmPC) which provides physicians, pharmacists and other health care professionals with details on how to use the medicine, the risks and recommendations for minimising them. An abbreviated version of this in lay language is provided in the form of the package leaflet (PL). The measures in these documents are known as routine risk minimisation measures.

This medicine has no additional risk minimisation measures (only routine risk minimisation measures)

#### VI.2.6 *Planned post authorisation development plan*

| Study title<br>Status  | Summary of objectives   | Safety concerns addressed      | Milestones  | Due dates |
|--|---|--------------------------------|-------------|-----------|
| <b>Category 1</b> - Imposed mandatory additional pharmacovigilance activities which are conditions of the marketing authorisation  |   |                                |             |           |
| Not applicable   |   |                                |             |           |
| <b>Category 2</b> – Imposed mandatory additional pharmacovigilance activities which are Specific Obligations in the context of a conditional marketing authorisation or a marketing authorisation under exceptional circumstances. |   |                                |             |           |
| Not applicable   |   |                                |             |           |
| <b>Category 3</b> - Required additional pharmacovigilance activities ( <b>Food and Drug Administration requirement</b> )   |   |                                |             |           |
|  | To obtain long-term clinical safety information in patients with NAGS | Assess treatment with CGA for: | Study start | Apr 2012  |
