

Evrysdi® (Risdiplam) Pulver zur Herstellung einer Lösung zum Einnehmen, 0,75 mg/ml Zul.-Nr. 67251

Public Risk Management Plan (RMP) Summary

Document Version 3.0 Document Date: 06.09.2024 Based on: EU-RMP Version 2.0

Roche Pharma (Schweiz) AG

Grenzacherstrasse 124 CH-4058 Basel pharma.schweiz@roche.com www.roche.ch/pharma Tel. +41 61 715 41 11

The Risk Management Plan (RMP) is a comprehensive document submitted as part of the application dossier for market approval of a medicine. The RMP summary contains information on the medicine's safety profile and explains the measures that are taken in order to further investigate and follow the risks as well as to prevent or minimise them.

The RMP summary of "Evrysdi" is a concise document and does not claim to be exhaustive. As the RMP is an international document, the summary might differ from the "Arzneimittelinformation / Information sur le médicament" approved and published in Switzerland, e.g. by mentioning risks occurring in populations or indications not included in the Swiss authorization.

Please note that the reference document which is valid and relevant for the effective and safe use of "Evrysdi" in Switzerland is the "Arzneimittelinformation/ Information sur le médicament" (see www.swissmedic.ch) approved and authorized by Swissmedic. "Roche Pharma (Schweiz) AG" is fully responsible for the accuracy and correctness of the content of the published summary RMP of Evrysdi.

PART VI: SUMMARY OF THE RISK-MANAGEMENT PLAN

Summary of Risk Management Plan for EVRYSDI (RISDIPLAM)

This is a summary of the risk-management plan (RMP) for Evrysdi. The RMP details important risks of Evrysdi, how these risks can be minimized, and how more information will be obtained about Evrysdi's risks and uncertainties (missing information).

Evrysdi's summary of product characteristics (SmPC) and its package leaflet give essential information to healthcare professionals and patients on how Evrysdi should be used.

This summary of the RMP for Evrysdi should be read in the context of all this information, including the assessment report of the evaluation and its plain-language summary, all which is part of the European Public Assessment Report (EPAR).

Important new concerns or changes to the current ones will be included in updates of Evrysdi's RMP.

1.1 I. THE MEDICINE AND WHAT IT IS USED FOR

Evrysdi is authorized for the treatment of 5q spinal muscular atrophy (SMA) in patients with a clinical diagnosis of SMA Type 1, Type 2 or Type 3 or with one to four *SMN2* copies (see SmPC for the full indication). It contains risdiplam as the active substance, and it is given as a solution by mouth or feeding tube.

Further information about the evaluation of Evrysdi's benefits can be found in Evrysdi's EPAR, including in its plain-language summary, available on the EMA Web site, under the medicine's Web page:

https://www.ema.europa.eu/en/medicines/human/EPAR/evrysdi

1.2 II. RISKS ASSOCIATED WITH THE MEDICINE AND ACTIVITIES TO MINIMIZE OR FURTHER CHARACTERIZE THE RISKS

Important risks of Evrysdi, together with measures to minimize such risks and the proposed studies for learning more about Evrysdi's risks, are outlined below.

Measures to minimize the risks identified for medicinal products can be:

- Specific Information, such as warnings, precautions, and advice on correct use, in the package leaflet and SmPC addressed to patients and healthcare professionals.
- Important advice on the medicine's packaging.

Gartenstrasse 9 CH-4052 Basel

- The authorized pack size—The amount of medicine in a pack is chosen so as to ensure that the medicine is used correctly.
- The medicine's legal status—The way a medicine is supplied to the patient (e.g., with or without prescription) can help to minimize its risks.

Together, these measures constitute *routine risk minimization* measures.

In addition to these measures, information about adverse events is collected continuously and regularly analyzed, including PSUR assessment, so that immediate action can be taken as necessary. These measures constitute *routine pharmacovigilance activities*.

If important information that may affect the safe use of Evrysdi is not yet available, it is listed under "missing Information" below.

1.2.1 II.A List of Important Risks and Missing Information

Important risks of Evrysdi are risks that need special risk-management activities to further investigate or minimize the risk, so that the medicinal product can be safely taken. Important risks can be regarded as identified or potential. Identified risks are concerns for which there is sufficient proof of a link with the use of Evrysdi. Potential risks are concerns for which an association with the use of this medicine is possible based on available data, but this association has not been established yet and needs further evaluation. Missing information refers to information about the safety of the medicinal product that is currently missing and needs to be collected (e.g., on the long-term use of the medicine, and in patients <1 month of age).

List of Important Risks and Missing Information	
Important identified risks	None
Important potential risks	Embryofetal toxicity Effect on epithelial tissues
Missing information	Long-term safety Safety data in patients <1 month of age

1.2.2 II.B Summary of Important Risks

Important Potential Ris	k: Embryofetal toxicity
Evidence for linking the risk to the medicine	Consistent with its effects on cell division and apoptosis, treatment of pregnant rabbits with risdiplam has been associated with maternal toxicity and teratogenicity, with a NOAEL at exposures of ~4 times the mean exposure guidance in clinical trials. No teratogenicity was observed in rats up to ~5 times the clinical mean exposure guidance, but embryofetal toxicity (reduced fetal weight and delayed fetal development) was noted, with a NOAEL slightly in excess of 2-fold the mean exposure guidance without maternal toxicity. Even though teratogenicity was only noted in the rabbit at a maternally toxic dose level, the possibility of a dysmorphogenic potential of risdiplam in the human cannot be discounted.
Risk factors and risk groups	Women who have been exposed to risdiplam during pregnancy or 1 month prior to the start of pregnancy
Risk-minimization measures	 Routine risk minimization measures: SmPC Section 4.4 (Special warnings and precautions for use) SmPC Section 4.6 (Fertility, pregnancy and lactation) SmPC Section 5.3 (Preclinical safety data) Section 2 of the Package Leaflet (What you need to know before you or your child take Evrysdi; Pregnancy, contraception, breastfeeding and male fertility) Routine risk-minimization activities recommending specific clinical measures to address the risk: SmPC Section 4.6 (Fertility, pregnancy and lactation)
Additional pharmacovigilance activities	Other risk minimization measures beyond the Product Information: Medicine's legal status: Risdiplam is a medicinal product subject to restricted medical prescription. Additional risk-minimization measures: None Additional pharmacovigilance activities: Study BN42833 Risdiplam Pregnancy Surveillance Study See Section II.C of this summary for an overview of the post-authorization development plan.

Gartenstrasse 9 CH-4052 Basel pharma.schweiz@roche.com www.roche.ch/pharma

Important Potential Ris	k: Effect on Epithelial tissues
Evidence for linking the risk to the medicine	In chronic toxicology studies in rodents and monkeys, adverse effects on epithelial tissues (skin, larynx, eyelid, and gastrointestinal tract) were observed. These effects were observed within days or weeks of treatment, were dose- dependent in severity, and occurred with high incidence. The first clinical sign in monkeys was mild parakeratosis at exposures more than 2.5-fold the exposure observed at the pivotal dose selected for patients with SMA. These findings were reversible upon discontinuation of dosing with risdiplam but persisted with continuous dosing and worsened at high doses with breakage of the skin barrier when animals were dosed through.
Risk factors and risk groups	Risk factors and risk groups: Skin events suggestive of effects on epithelial tissues have not been observed in humans therefore risk factors and risk groups cannot be identified in humans and must be extrapolated from nonclinical studies. Overdoses are a potential risk factor for effects on epithelial tissues based on findings in the nonclinical studies.
Risk-minimization measures	 Routine risk minimization measures: Section 5.3 of the SmPC (Preclinical safety data; Effect on epithelial tissues) Other risk minimization measures beyond the Product Information: Medicine's legal status: Risdiplam is a medicinal product subject to restricted medical prescription. Additional risk-minimization measures: None
Additional pharmacovigilance activities	 Additional pharmacovigilance activities: OLE until 5 years of treatment for all patients in following studies: Study BP39056 (FIREFISH) Study BP39055 (SUNFISH) Study BP39054 (JEWELFISH) Study BN40703 (RAINBOWFISH) See Section II.C of this summary for an overview of the post-authorization development plan.

Gartenstrasse 9 CH-4052 Basel pharma.schweiz@roche.com www.roche.ch/pharma

Missing Information: Long-term safety	
Risk-minimization measures	Other risk minimization measures beyond the Product Information:
	Medicine's legal status: Risdiplam is a medicinal product subject to restricted medical prescription.
	No additional risk-minimization measures
Additional	Additional pharmacovigilance activities:
pharmacovigilance activities	Study BP42817 (QTc Study)
	OLE until 5 years of treatment for all patients in following studies:
	Study BP39056 (FIREFISH)
	Study BP39055 (SUNFISH)
	Study BP39054 (JEWELFISH)
	Study BN40703 (RAINBOWFISH)
	See Section II.C of this summary for an overview of the post-authorization development plan

Missing Information: Safety in patients <1 month of age	
Risk-minimization measures	Other risk minimization measures beyond the Product Information:
	Medicine's legal status: Risdiplam is a medicinal product subject to restricted medical prescription.
	No additional risk-minimization measures
Additional	Additional pharmacovigilance activities:
pharmacovigilance	Study BN44619
activities	See Section II.C of this summary for an overview of the post-authorization development plan.

1.2.3 II.C Post-Authorization Development Plan

1.2.3.1 II.C.1 Studies that are Conditions of the Marketing Authorization

The following studies are conditions of the marketing authorization.

Study short name: Non Interventional Post-Authorization Efficacy Study (PAES) BN43428

Purpose of the study

A long-term prospective, observational study to further evaluate disease progression in SMA patients (both pre-symptomatic and symptomatic) with 1 to 4 *SMN2* copies treated with risdiplam, in comparison to natural history data in untreated patients.

1.2.3.2 II.C.2 Other Studies in Post-Authorization Development Plan Study short name: Study BP39056 (FIREFISH) Open-Label Extension

Purpose of the study

Continued general safety and effects on epithelial tissues in the OLE phase of ongoing clinical studies in SMA patients will occur for treatment duration of 5 years (study duration of 2 years, followed by 3 years OLE).

Study short name: Study BP39055 (SUNFISH) Open-Label Extension

Purpose of the study

Continued general safety and effects on epithelial tissues in the OLE phase of ongoing clinical studies in SMA patients will occur for treatment duration of 5 years (study duration of 2 years, followed by 3 years OLE).

Study short name: Study BP39054 (JEWELFISH) Open-Label Extension Purpose of the study

Continued general safety and effects on epithelial tissues in the OLE phase of ongoing clinical studies in SMA patients will occur for treatment duration of 5 years (study duration of 2 years, followed by 3 years OLE).

Gartenstrasse 9 CH-4052 Basel pharma.schweiz@roche.com www.roche.ch/pharma Tel. +41 61 715 41 11

Study short name: Study BN40703 (RAINBOWFISH) Open-Label Extension Purpose of the study

Continued general safety and effects on epithelial tissues in the OLE phase of ongoing clinical studies in SMA patients will occur for treatment duration of 5 years (study duration of 2 years, followed by 3 years OLE).

Study short name: Study BN42833 (Risdiplam Pregnancy Surveillance Study) Purpose of the study

To collect and describe selected pregnancy outcomes (i.e., live birth, spontaneous abortions, stillbirths, elective abortions, and preterm births) and pregnancy complications in women with SMA exposed to risdiplam during the defined exposure window.

To collect and describe selected fetal/neonatal/infant outcomes (i.e., major and minor congenital malformations, small for gestational age, and postnatal growth and development) at birth and through up to the first year of life of infants born to women exposed to risdiplam during the defined pregnancy exposure window.

Study short name: Study BP42817 (QTc Study)

Purpose of the study

To estimate the effects of single oral doses of risdiplam on QT interval of the ECG (QT)/QT corrected for heart rate (QTc) interval in healthy subjects.

Study short name: Study BN44619 (PUPFISH)

Purpose of the study

To generate pharmacokinetic (PK) and safety data on the use of risdiplam treatment in patients with spinal muscular atrophy (SMA) aged under 20 days of age at first dose.
